Savings Vault Tracker

Problem Statement

Users often struggle to maintain consistent saving habits due to the lack of simple, transparent, and accountable tools. Current digital platforms enable spending but do not effectively support structured savings with clear progress tracking.

Design a **wallet-linked savings vault on the Algorand blockchain** that allows users to deposit ALGO and track their savings in a secure, transparent, and verifiable manner.

Objective

Build a decentralized savings application that enables users to deposit ALGO, monitor their total savings, and track milestone-based progress using on-chain data.

Core Requirements

- **Wallet Integration:** Connect Algorand wallet and enable secure deposits
- **Savings Tracking:** Maintain per-user savings using on-chain local state
- **Milestone System:** Define and display progress toward savings goals
- **Transaction History:** Record and display user deposits

Suggested Implementation (Algorand)

- Use **AlgoKit** for development and deployment
- Store user savings in **local state** and milestones in **global state**
- Use **grouped transactions (payment + app call)** to sync funds and state
- Fetch on-chain data in the frontend for real-time tracking

Expected Solution

The solution should be a **scalable and user-friendly dApp on Algorand** that leverages **AlgoKit, wallet integration, and grouped transactions**. It must securely handle deposits, track user savings on-chain, and provide transparent progress visibility. The application should ensure consistency between transactions and state while delivering a seamless user experience and real-world usability.

Evaluation Focus

- Innovation & Creativity
- Technical Implementation on Algorand
- Use of AlgoKit, on-chain state, and grouped transactions
- User Experience & Design
- Real-world Impact
