Milestone Approval Assistant

Problem Statement

Project payouts are often delayed due to unclear or manual milestone validation, leading to disputes and inefficiencies.

Build a **decentralized milestone validation assistant on Algorand** that verifies deliverables and triggers payouts only when predefined conditions are met.

Objective

Enable transparent, automated milestone tracking where submissions are validated on-chain and payouts are released securely upon approval.

Core Requirements

- Define milestones with amount and acceptance criteria
- Submit deliverable evidence (hash-based proof)
- Validate submissions against predefined rules
- Track milestone status (pending/approved/rejected)
- Trigger payouts only after approval

Algorand Implementation

- Store milestones on-chain with conditions and payout amounts
- Commit **evidence hash** to the smart contract for auditability
- Enforce payout via **application call** only after approval
- Maintain milestone state transitions on-chain to prevent disputes

Scope

- Define milestone criteria
- Submit evidence
- Validate submission
- Approve milestone
- Trigger payout
