Goal-Based Piggy Bank

Problem Statement

Users often struggle to save consistently for specific goals like rent, travel, or gadgets due to lack of structure and accountability. Existing tools do not provide goal-wise tracking with enforced saving discipline.

Build a **multi-goal savings vault on Algorand** where users can create goals, deposit funds, track progress, and withdraw only when predefined conditions are met.

Objective

Enable users to define multiple savings goals with targets and timelines, deposit ALGO, and securely manage funds with on-chain enforcement.

Core Requirements

- Create multiple goals (target + deadline)
- Deposit ALGO into goal-specific vaults
- Track progress (amount + percentage)
- Show goal status (active/completed/expired)
- Allow withdrawals only when conditions are met

Algorand Implementation

- Store goals using **box storage** (wallet + goal ID)
- Lock funds in **application account**
- Enforce unlock rules on-chain (target reached / deadline passed)

- Use **ABI methods** for create, deposit, withdraw

Scope

- Create goal
- Deposit funds
- Track progress
- Complete goal
- Withdraw funds
