Bounty Escrow Agent

Problem Statement

Open bounty platforms often face trust issues around work completion and payout reliability, leading to disputes between creators and contributors.

Build a **decentralized bounty escrow system on Algorand** that locks funds, verifies submissions, and ensures fair payouts through on-chain rules.

Objective

Enable trustless bounty workflows where funds are escrowed, submissions are verifiable, and payouts are automatically executed based on predefined conditions.

Core Requirements

- Post bounties with reward, terms, and deadline
- Lock funds securely in escrow
- Submit work proof (hash-based evidence)
- Validate completion against conditions
- Enable payout or dispute resolution

Algorand Implementation

- Lock bounty funds in the **application account** at creation
- Store bounty details (terms, deadline) on-chain
- Submit **completion proof hash** via app call
- Enforce release/refund logic on-chain to reduce trust dependency

Scope

- Post bounty & lock funds
- Submit work
- Validate completion
- Release payout or initiate dispute
