AI Meeting-to-Action System

Problem Statement

Meetings often generate important decisions, action items, and responsibilities, but these outcomes are frequently lost in unstructured discussions or scattered notes. Existing tools focus on recording or transcription, not on converting conversations into actionable workflows. This leads to missed tasks, unclear ownership, and reduced accountability.

Objective

Build an AI-powered system that converts meeting inputs (audio, transcripts, or notes) into structured, trackable tasks, enabling teams to move efficiently from discussion to execution.

Key Features

- Support for audio, transcript, and text inputs
- AI extraction of action items, deadlines, and stakeholders
- Automatic task dashboard generation
- Reminders and notifications for pending work
- Editable and collaborative task management

Agentic AI Component

Develop an AI agent that:

- Tracks task progress

- Sends intelligent follow-ups
- Adjusts deadlines based on context
- Flags delays and incomplete tasks

Expected Impact

- Improved accountability and task ownership
- Reduced information loss
- Faster execution of decisions
- Better team collaboration and productivity
